Summary

Data Engineer with 6+ years of experience designing, deploying, and operating production batch, streaming, and event-driven data pipelines across **Snowflake**, Amazon Redshift, and BigQuery on AWS and GCP. Builds reliable, governed data platforms — MERGE-based upserts, schema-drift handling, automated quality checks and financial reconciliation, audit-logged observability, and dev/stage/prod deployments — powering executive and board-level reporting across **$1B+ in payment activity**. Experienced with sensitive payment and PII data and partnering with Finance, Operations, and Engineering stakeholders.

Technical Skills

Languages: SQL, Python, PySpark, PL/pgSQL, Node.js, Scala, Java

Data Warehousing & Databases: Snowflake, Amazon Redshift (Zero-ETL, Data API), Google BigQuery, Aurora MySQL, PostgreSQL, MongoDB

Pipelines & Orchestration: Apache Airflow, dbt, Apache Spark, Databricks, AWS Glue, AWS Lambda, EventBridge, Airbyte, Fivetran, Informatica

Streaming & Event Data: Kafka, Apache Flink, Spark Streaming, BigQuery Streaming API, Segment, Rudderstack, Hightouch, Parquet

Cloud & Infrastructure: AWS (S3, EMR, Athena, SAM, Secrets Manager), GCP (Cloud Storage, Compute Engine, Cloud Functions)

CI/CD & Observability: Git, GitHub Actions, Docker, AWS SAM (IaC), Datadog (Monitoring, RUM), Audit Logging, Anomaly Detection

BI & Visualization: Amazon QuickSight, Looker, Tableau, Power BI, Metabase

Core Competencies: Data Modeling (Star Schema, Dimensional), ELT/ETL Design, Data Quality & Reconciliation, Schema Governance, Monitoring & Alerting, Partitioning & Clustering, Query Tuning, Database Migration, Data Privacy (GDPR)

Experience

Lead Data Engineer | **Concierge Plus Inc.** (Remote) **December 2024 – Present**

- Built a **serverless Datadog RUM → Amazon Redshift pipeline** on AWS Lambda, replacing heavy SDKs with paginated REST calls (**~3.8x faster fetch**) and staging compressed Parquet into **PL/pgSQL COPY + MERGE stored procedures** that upsert **millions of session records** across rolling 30-day windows with near-zero duplication.
- Hardened the same pipeline against **upstream schema drift** with a fixed-column allowlist and added **Redshift Data API polling, timeout safety margins, and per-run timing logs**, delivering fully automated, fault-tolerant runs with zero manual intervention.
- Led the **zero-downtime Blue/Green migration of multi-tenant Aurora MySQL clusters from 5.7 to 8.0**, remediating upgrade blockers (ROW_FORMAT=DYNAMIC, row-based binlogs, orphaned full-text indexes) and aligning binlog configuration to keep **Redshift Zero-ETL replication** live for downstream analytics.
- Consolidated **~1,000 client databases into Amazon Redshift** via external MySQL links and aggregation SQL, powering 10+ executive QuickSight dashboards tracking **over $1B in total payment activity** — eliminating 100% of manual reporting and cutting turnaround **from weeks to seconds.**
- Designed a **financial data model in Redshift** unifying FAPS credit card, ACH, and residual reports (fees, chargebacks, returns, net take rate) for board-level reporting, **reconciling to within $200–$500 per month (99.9%+ accuracy)** and **cutting reporting prep by 70–80%.**
- Built **production payment ingestion pipelines on AWS Lambda** (Python for Payrix across US & CA; Node.js for 4 FAPS data streams) scheduled via EventBridge and deployed with **AWS SAM across dev, stage, and prod** with Secrets Manager credentials and **audit logs of status, row counts, and errors per run** — **reducing data delivery time by 95%.**
- Integrated **HubSpot (via Airbyte), QuickBooks, and Chargebee** into Redshift with SQL transformation layers behind executive dashboards for support performance across 10+ agents, SaaS delinquency aging (30/60/90+ days), and client churn.

Data Engineer | **3C Labs** (Indianapolis, IN) **May 2024 – December 2024**

- Architected a **Python and SQL consolidation pipeline** integrating 16 advertising platform APIs into a unified warehouse, enabling vendor consolidation from 16 to 4 and **saving $1.2M** while maintaining revenue.
- Developed an incremental **HubSpot API → BigQuery pipeline** with **automated data quality checks and anomaly detection** on materialized views, **achieving 99.9% data accuracy** and eliminating manual processing.

- Engineered a **Klaviyo → BigQuery email analytics pipeline** processing **1M+ campaign metrics** with Looker dashboards — **50% faster reporting and 20% higher engagement.**

Data Engineer | Athotel (Remote) **May 2023 – December 2023**

- Designed a **real-time auction analytics system using BigQuery Streaming APIs and materialized views** with event-driven Cloud Functions rate alerts, giving suppliers **self-service competitive insights without exposing sensitive data — cutting analysis time by 30% and improving supplier pricing by 15%.**
- Modeled the **4R data model** (Revenue, Retention, Referrals, Reviews) in **dbt and BigQuery using a star schema** with automated data quality tests and cohort analysis — **lifting rebooking rates by 12% in 90 days.**

Lead Data Engineer | 5x **January 2022 – August 2022**

- Re-architected **high-volume customer.io webhook ingestion** off the production MySQL database into **Parquet files on GCS queried as BigQuery external tables**, absorbing **100K+ webhook events** and freeing the production database.
- Designed a **multi-source event ingestion framework using Segment and Rudderstack**, tuning BigQuery tables with **partitioning and clustering** to **reduce query latency by 30% across 50GB+ of daily data.**
- Automated **reverse ETL syncs from BigQuery to HubSpot and Slack via Hightouch** on 5-minute schedules for **13K+ monthly app users**.

Data Engineer | Tietoevry **September 2019 – January 2022**

- Architected **batch ELT pipelines orchestrated with Apache Airflow and PySpark**, loading **100 GB of daily data** into a **Snowflake data warehouse**, and optimized pipelines on Databricks with **DataDog monitoring — 30% faster processing.**
- Built a **centralized Snowflake data warehouse with dbt**, implementing data quality frameworks that reduced inconsistencies and improved reporting accuracy for retail and workforce data.
- Supported a **GDPR data protection initiative** for retail sales data containing customer **PII** (card numbers, phone numbers, emails), applying privacy controls across storage and cleansing workflows.
- Engineered a **real-time streaming architecture using Kafka and Apache Spark** and led migration to **AWS (S3, Redshift, Glue)** with **CI/CD via Docker and GitHub Actions**, maintaining **99.9% uptime.**

Personal Projects

Automated Ad Compliance Pipeline | *Python, Google Cloud Vision, GCP* [Link]

- Built an automated validation pipeline using **Python and Google Cloud Vision** to check ad image specs and flag policy-violating terms before publishing, significantly reducing manual review cycles.

Education

Indiana University, Bloomington **August 2022 – May 2024**
Master of Science in Computer Science *GPA: 3.75/4.00*

Vivekanand Education Society's Institute of Technology **July 2015 – May 2019**
Bachelor of Science in Computer Engineering *GPA: 3.54/4.00*
